

# SYSSTEM<sup>®</sup>-SEACAL

## Want Quality & Yield?

Calcium is a critical nutrient in growing quality fruit and vegetables. Getting calcium into the crop during the fruit “cell-division” window is the key to improving crop quality, marketable pack-out and grower profitability. Maximizing calcium levels in the fruit will improve cell wall thickness leading to improved skin appearance, transportability and shelf-life. Every crop is different, but supporting each crop’s peak demand timing for calcium is what matters most in determining crop quality and maximizing pack-out.

Agro-K’s foliar calcium phosphite, **Sysstem-SeaCal**, combines the systemic power of calcium in a highly mobile phosphite form with Agro-K’s proprietary seaweed extract formulation. Applying **Sysstem-SeaCal** starting pre-bloom and continuing through fruit cell-division not only encourages fruit size but also provides a

readily available calcium that penetrates rapidly and thoroughly through leaf and fruit tissue due to its unique phosphite formulation. In addition, **Sysstem-SeaCal**, unlike most foliar phosphite products on the market, contains no potassium. Foliar potassium applied during fruit cell-division can antagonize calcium uptake into the fruit and negatively impact fruit quality later.

Combining Agro-K’s unique foliar phosphite calcium and foliar seaweed extract gives growers a convenient powerful tool to positively impact fruit quality, marketable pack-out and grower profitability. For more information on **Sysstem-SeaCal** and Agro-K’s complete nutrient product lines, contact Agro-K or an authorized distributor today.
