

Looking to increase walnut yields in 2014?

Husk fly/codling moth sprays

System® Series late season NutBuilder nutrient program.

The best time to nutritionally impact next years walnut crop is your husk fly/codling moth sprays.

Highly penetrating, systemically transported System-Ready® applied along with husk fly and codling moth sprays with other early season peak demand nutrients needed to build bud strength (potassium, phosphate, boron) make it possible to get these critical nutrients into next year's buds so they are available when the tree breaks dormancy in the spring. Building nutrient levels in the buds this year, leads to more uniform bud break, faster early growth with larger leaves that have more photosynthetic capability and stronger flower buds for better set. The end result... higher yields, larger and heavier nuts in 2014.

Building nutrient levels this year sends trees and buds into winter with more strength and energy reserves that will be available to the tree next spring at bud break when cool soils limit uptake and nutrient availability. Applying System-Ready with Agrobest 0-18-25 + B with husk fly/codling moth applications will ensure the tree has zinc and other critical early nutrients ahead of spring peak demand timing to support leaf and root development. By beginning to manage next year's nutrient needs this year, System-Ready helps prepare your trees for the goal of higher yields – with larger, higher quality nuts, while also minimizing alternate bearing issues.

System-Ready is compatible with most pesticides and foliar nutrient tank mixes.
